| Description | | | |
| <p>One of the features of Mininet and Mininet-Wifi we presently don't support is starting with an empty topology and adding nodes to an existing network- this is used frequently in their examples, such as that for SUMO. We presently assume use of a topology file when no topology object is passed into Mini-NDN, which presently makes this impossible. Adding this will make applying Mininet and Mininet-Wifi examples to Mini-NDN easier.</p> | | | |
